1 Expansion

1.1 from time to scale factor

We have two kinds of “time” in cosmology since our Universe are expanding.

If we focus on the **coordinate**, the metric is written as (c=1)

$$ds^2 = dt^2 + a^2(t)(dx^2 + dy^2 + dz^2) \quad (1)$$

$$a dx \quad (2)$$

By scaling the time axis, we can get the **conformal time**, which is equalized to the space coordinates

$$ds^2 = a^2(t)(d\tau^2 + dx^2 + dy^2 + dz^2) \quad (3)$$

The **scale factor** can be solved from the **Friedmann equation**,¹

$$\left(\frac{\dot{a}}{a}\right)^2 = \frac{8\pi G}{3}\rho \quad (4)$$

with **the model of energy-momentum** contained in the Universe²

$$\frac{\rho(t)}{\rho_{\text{cr}}} = \sum_{s=\gamma, \text{m}, \nu, \text{DE}} \Omega_s a(t)^{-3(1+w_s)} \quad (5)$$

This model assumes a constant of equation of state.

$$\frac{\rho(t)}{\rho_{\text{cr}}} = \Omega_R \left(\frac{a}{a_0}\right)^{-4} + \Omega_M \left(\frac{a}{a_0}\right)^{-3} + \Omega_\Lambda + \Omega_K \left(\frac{a}{a_0}\right)^{-2} \quad (6)$$

just solve the differential equation

$$\dot{a} = H_0 a_0 \sqrt{\Omega_R \left(\frac{a}{a_0}\right)^{-2} + \Omega_M \left(\frac{a}{a_0}\right)^{-1} + \Omega_\Lambda \left(\frac{a}{a_0}\right)^2 + \Omega_K} \quad (7)$$

$$t = \int_0^{a_1} \frac{da}{H_0 a_0 \sqrt{\Omega_R \left(\frac{a}{a_0}\right)^{-2} + \Omega_M \left(\frac{a}{a_0}\right)^{-1} + \Omega_\Lambda \left(\frac{a}{a_0}\right)^2 + \Omega_K}} \quad (8)$$

¹also deriving the Friedmann equations from Einstein field equation is not that trivial, see another block in preparation..

²Friedmann equation itself has assumptions about the energy-momentum, it's **ideal fluid** which can be parameterized by only ρ and P ..

It's not linear, so need numerical solution.

But it's OK to see some exceptions. matter dominated:

$$\dot{a} = H_0(a_0\Omega_M)^{\frac{1}{2}}a^{-\frac{1}{2}} \quad (9)$$

then

$$t = \frac{2}{3H_0(a_0\Omega_M)^{\frac{1}{2}}}a^{\frac{3}{2}} \quad (10)$$

assumed $a(t=0) = 0$.

2 Hubble follow

$$v_H = \dot{a}\chi = H_0(a_0\Omega_M)^{\frac{1}{2}}a^{-\frac{1}{2}} \quad (11)$$

L^AT_EX

$$H. \quad (12)$$

$$H|\psi\rangle \quad (13)$$
